About: Downtown Los Angeles
 An Entity of Type : [Neighborhoods in Los Angeles, California](#)
 Type: `yago:NeighborhoodsInLosAngeles,California`

Downtown Los Angeles is the central business district of Los Angeles, California, United States, located close to the geographic center of the metropolitan area. The area features many of the city's major arts institutions and sports facilities, sightseeing opportunities, a variety of skyscrapers and associated large multinational corporations and an array of public art and unique shopping opportunities. Downtown is the hub of the city's freeway network and growing Metro rapid transit system.

Web APIs

API Data Formats, 03/08/2011

The Problem

Motivation Example

For most of the Web APIs, only a textual description is available

Most of the Web APIs do not consume or produce linked data (RDF)

RDF Input

```
<http://sws.geonames.org/5145067/>  
  a gn:Feature ;  
  wgs84:lat "40.78343" ;  
  wgs84:long "-73.96625" .
```

Linked RDF

```
<http://sws.geonames.org/5145067/>  
  gn:neighbour [  
    a gn:Feature ; gn:name "Woodside";  
    gn:nearby [  
      a gn:Feature ; gn:name "...-Queens";  
      gn:parentCountry [ ...
```

Neighbourhood / reverse geocoding

The neighbourhood for US cities. Data provided by [Zillow](#) under c

Webservice Type : REST
Url : [api.geonames.org/neighbourhood?](#)
Parameters : lat,lng
Result : returns the neighbourhood for the given latitude/longitude

Invocation Example

Example <http://api.geonames.org/neighbourhood?lat=40.78343&lng=-73.96625&username=demo>

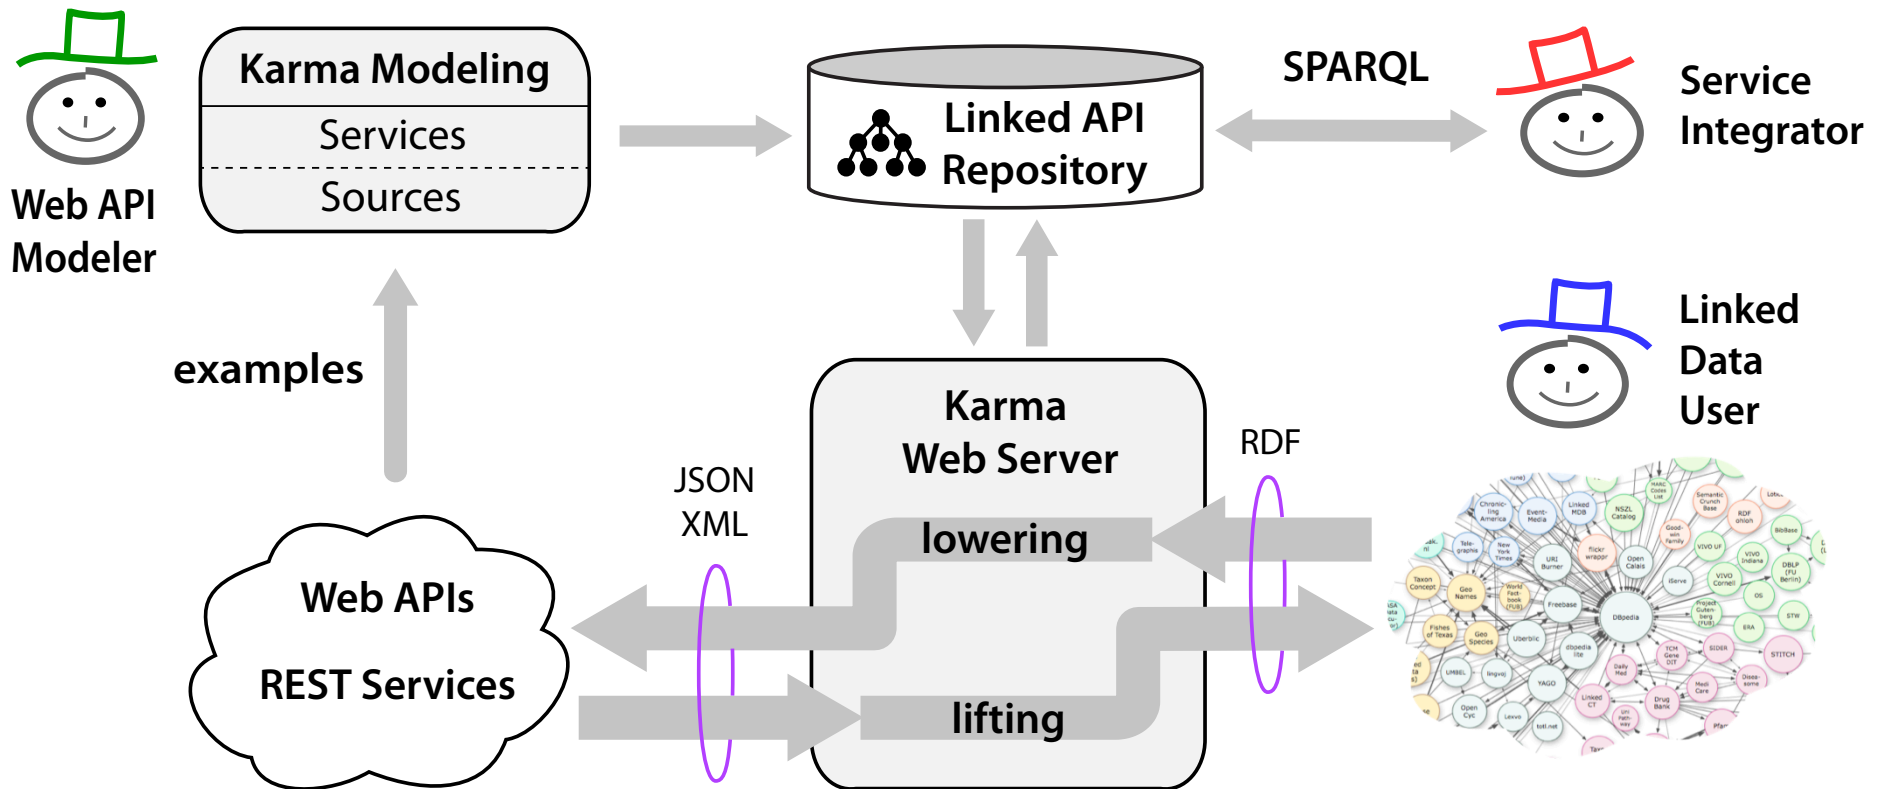

```
<geonames>  
  <neighbourhood>  
    <countryCode>US</countryCode>  
    <countryName>United States</countryName>  
    <adminCode1>NY</adminCode1>  
    <adminName1>New York</adminName1>  
    <adminCode2>061</adminCode2>  
    <adminName2>New York County</adminName2>  
    <city>New York City-Manhattan</city>  
    <name>Central Park</name>  
  </neighbourhood>  
</geonames>
```

Overview

The Semantic Model

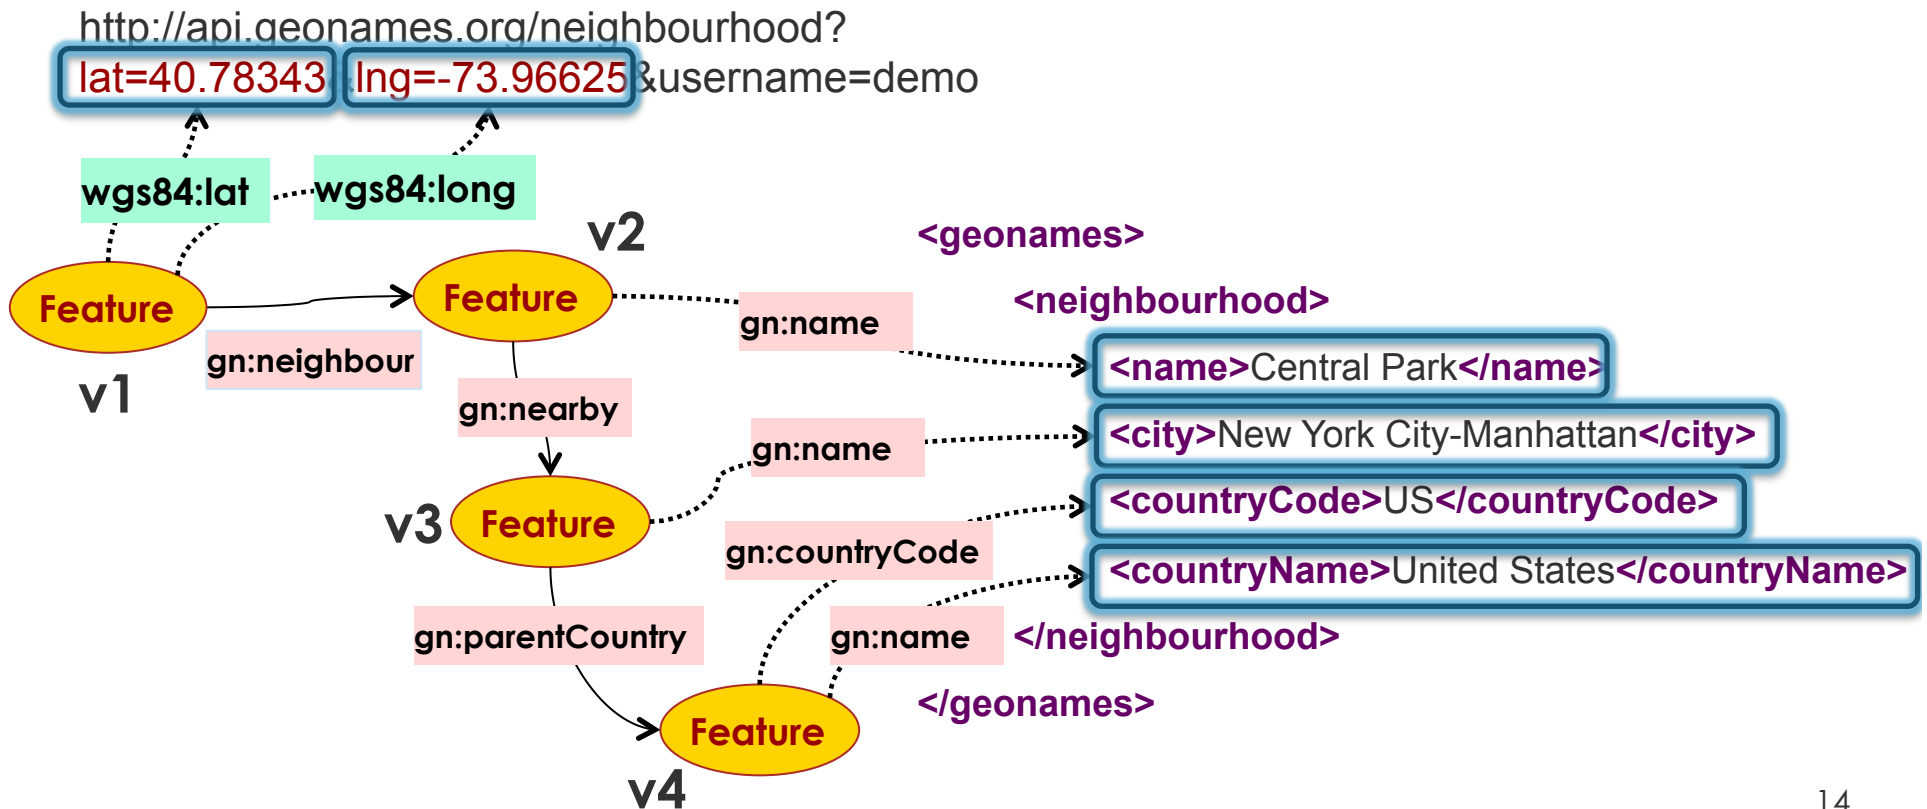

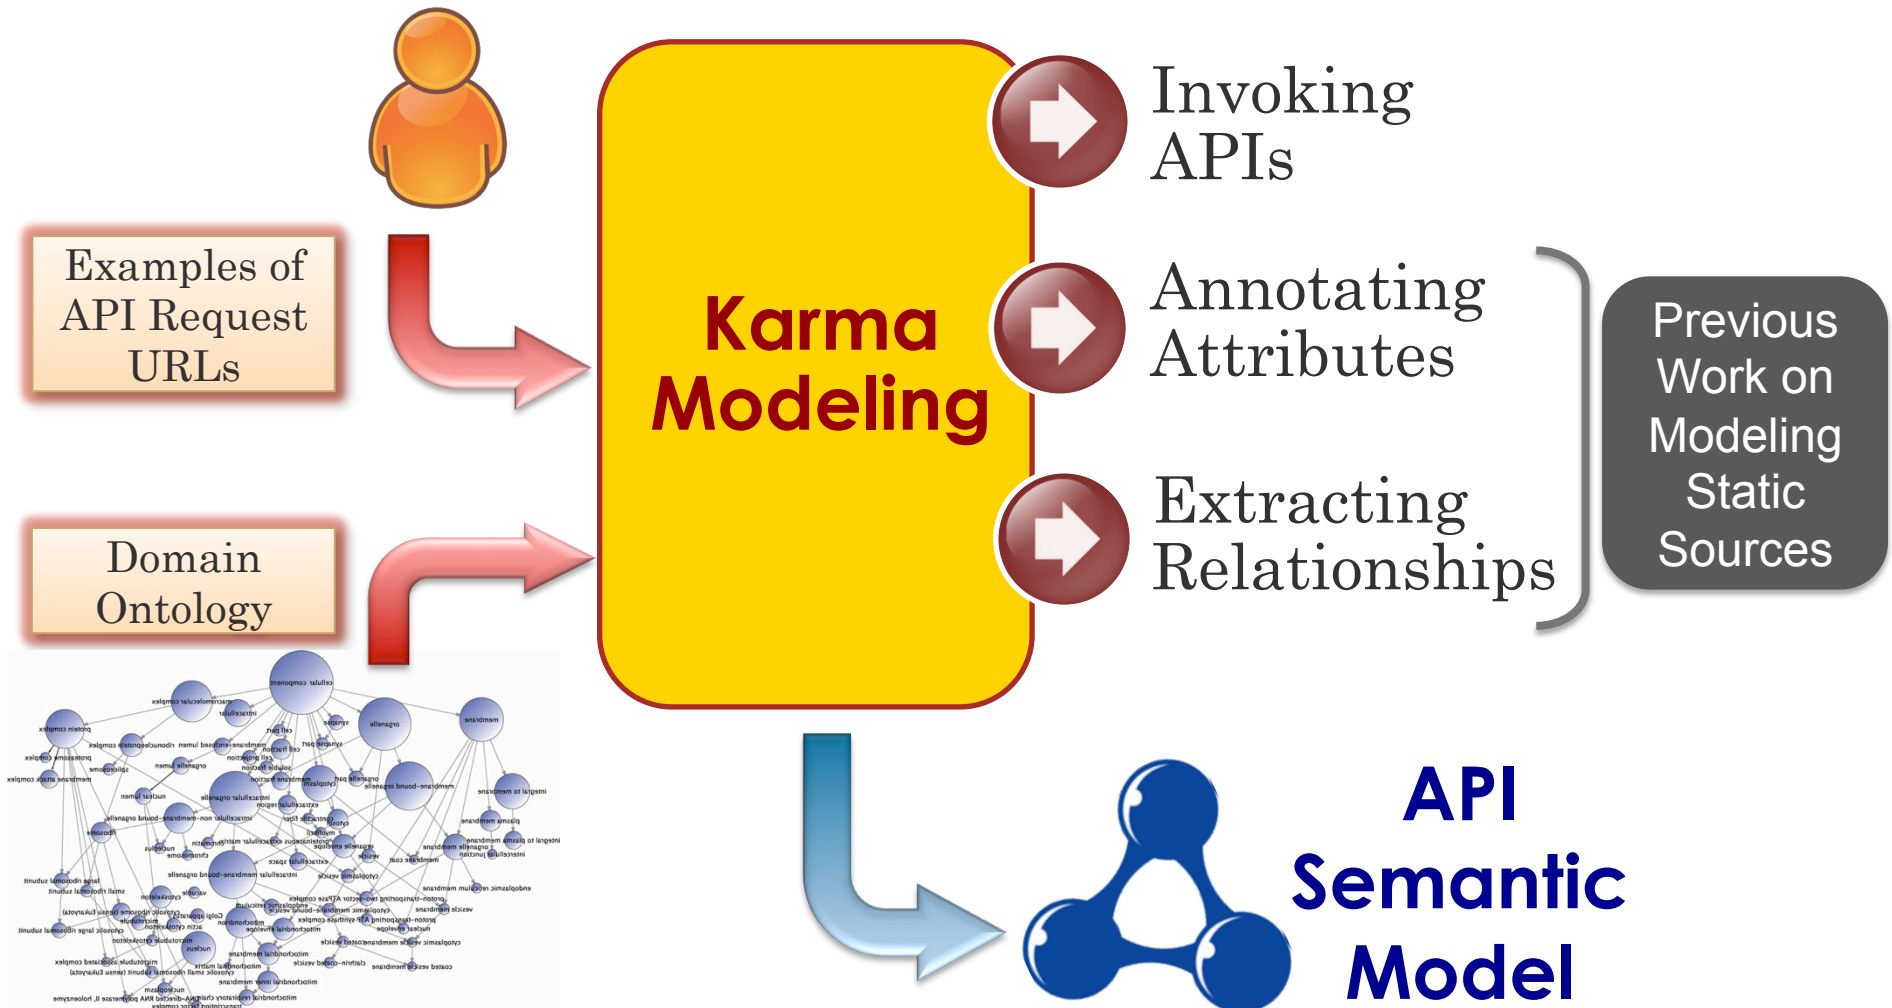

[http://api.geonames.org/neighbourhood?](http://api.geonames.org/neighbourhood?lat=40.78343&lng=-73.96625&username=demo)
lat=40.78343 lng=-73.96625 &username=demo

The Semantic Model

$\text{neighbourhood}(\$lat, \$long, @countryCode, @countryName, @city, @name) \rightarrow$
 $\text{gn:Feature}(v1) \wedge \text{wgs84:lat}(v1, \$lat) \wedge \text{wgs84:long}(v1, \$long) \wedge \text{gn:neighbourhood}(v1, v2) \wedge$
 $\text{gn:Feature}(v2) \wedge \text{gn:name}(v2, @name) \wedge \text{gn:nearby}(v2, v3) \wedge$
 $\text{gn:Feature}(v3) \wedge \text{gn:name}(v3, @city) \wedge \text{gn:parentCountry}(v3, v4) \wedge$
 $\text{gn:Feature}(v4) \wedge \text{gn:countryCode}(v4, @countryCode) \wedge \text{gn:name}(v4, @countryName)$

Invoking APIs

- User provides examples of the API request URLs
- Karma extracts the input values from the sample request URLs
- Karma invokes the API and extracts the output attributes from the API response (XML/JSON)

Examples of API
Invocation URLs

The screenshot shows a web interface with a search bar containing the word "neighbourhood". Below the search bar, there is a table with the following content:

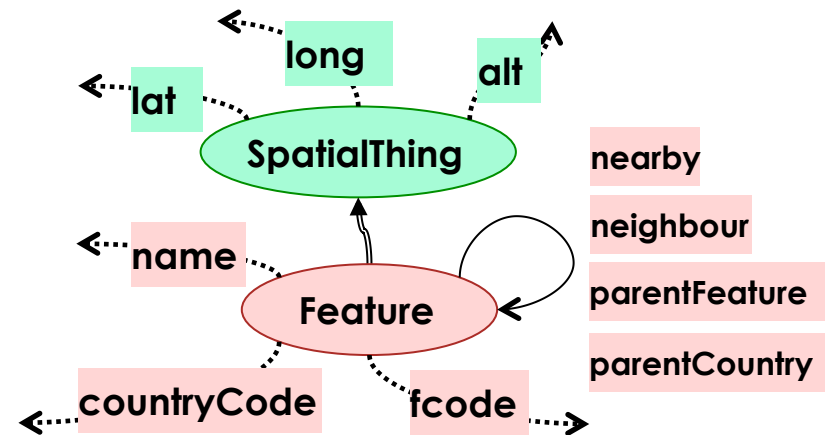

| request url |
|---|
| http://api.geonames.org/neighbourhood?at=40.78343&lng=-73.96625&username=karma |
| http://api.geonames.org/neighbourhood?at=40.71012&lng=-73.90078&username=karma |
| http://api.geonames.org/neighbourhood?at=40.90145&lng=-73.90815&username=karma |

Below the table, there is a link that says "Show: 10 20 50 records".

Annotating Inputs and Outputs

[Goel, Knoblock, Lerman, 2012]

- A CRF-based model to assign a **Semantic Type** to each column from its data
- Semantic Type
 - Ontology Class
 - Data Property + Domain

(wgs84:lat, gn:Feature)

| lat | lng | username | countryCode | countryName | city | name |
|----------|-----------|----------|-------------|---------------|-------------------------|--------------|
| 40.78343 | -73.96625 | karma | US | United States | New York City-Manhattan | Central Park |
| 40.71012 | -73.90078 | karma | US | United States | New York City-Queens | Ridgewood |

(wgs84:long, gn:Feature)

(gn:name, gn:Feature)

```

```
km:hasAttribute :in lat, ... ;
```

```
km:hasModel :inputModel.
```

```
:in lat a km:Attribute; km:hasName "lat" ;
```

```
  hrests:isGroundedIn "p1"^^rdf:PlainLiteral.
```

```
...
```

```
:feature1 a swrl:Variable .
```

```
:inputModel a km:Model;
```

```
km:hasAtom [ a swrl:ClassAtom ;
```

```
  swrl:classPredicate gn:Feature;
```

```
  swrl:argument1 :feature1 ];
```

```
km:hasAtom [ a swrl:IndividualPropertyAtom;
```

```
  swrl:propertyPredicate wgs84:lat;
```

```
  swrl:argument1 :feature1;
```

```
  swrl:argument2 :in lat];
```

```
:output a km:Output;
```

```
km:hasAttribute :out name, ... ; km:hasModel :outputModel.
```

```
:out name a km:Attribute; km:hasName "name" .
```

```
...
```

```
:feature2 a swrl:Variable . :outputModel a km:Model;
```

```
km:hasAtom [ a swrl:ClassAtom ;
```

```
  swrl:classPredicate gn:Feature;
```

```
  swrl:argument1 :feature2 ];
```

```
km:hasAtom [ a swrl:IndividualPropertyAtom ;
```

```
  swrl:propertyPredicate gn:neighbour;
```

```
  swrl:argument1 :feature1 ;
```

```
  swrl:argument2 :feature2];
```

```
km:hasAtom [ a swrl:IndividualPropertyAtom ;
```

```
  swrl:propertyPredicate gn:name ;
```

```
  swrl:argument1 :feature2 ;
```

```
  swrl:argument2 :out name];
```

- Finds all services that take latitude and longitude as inputs

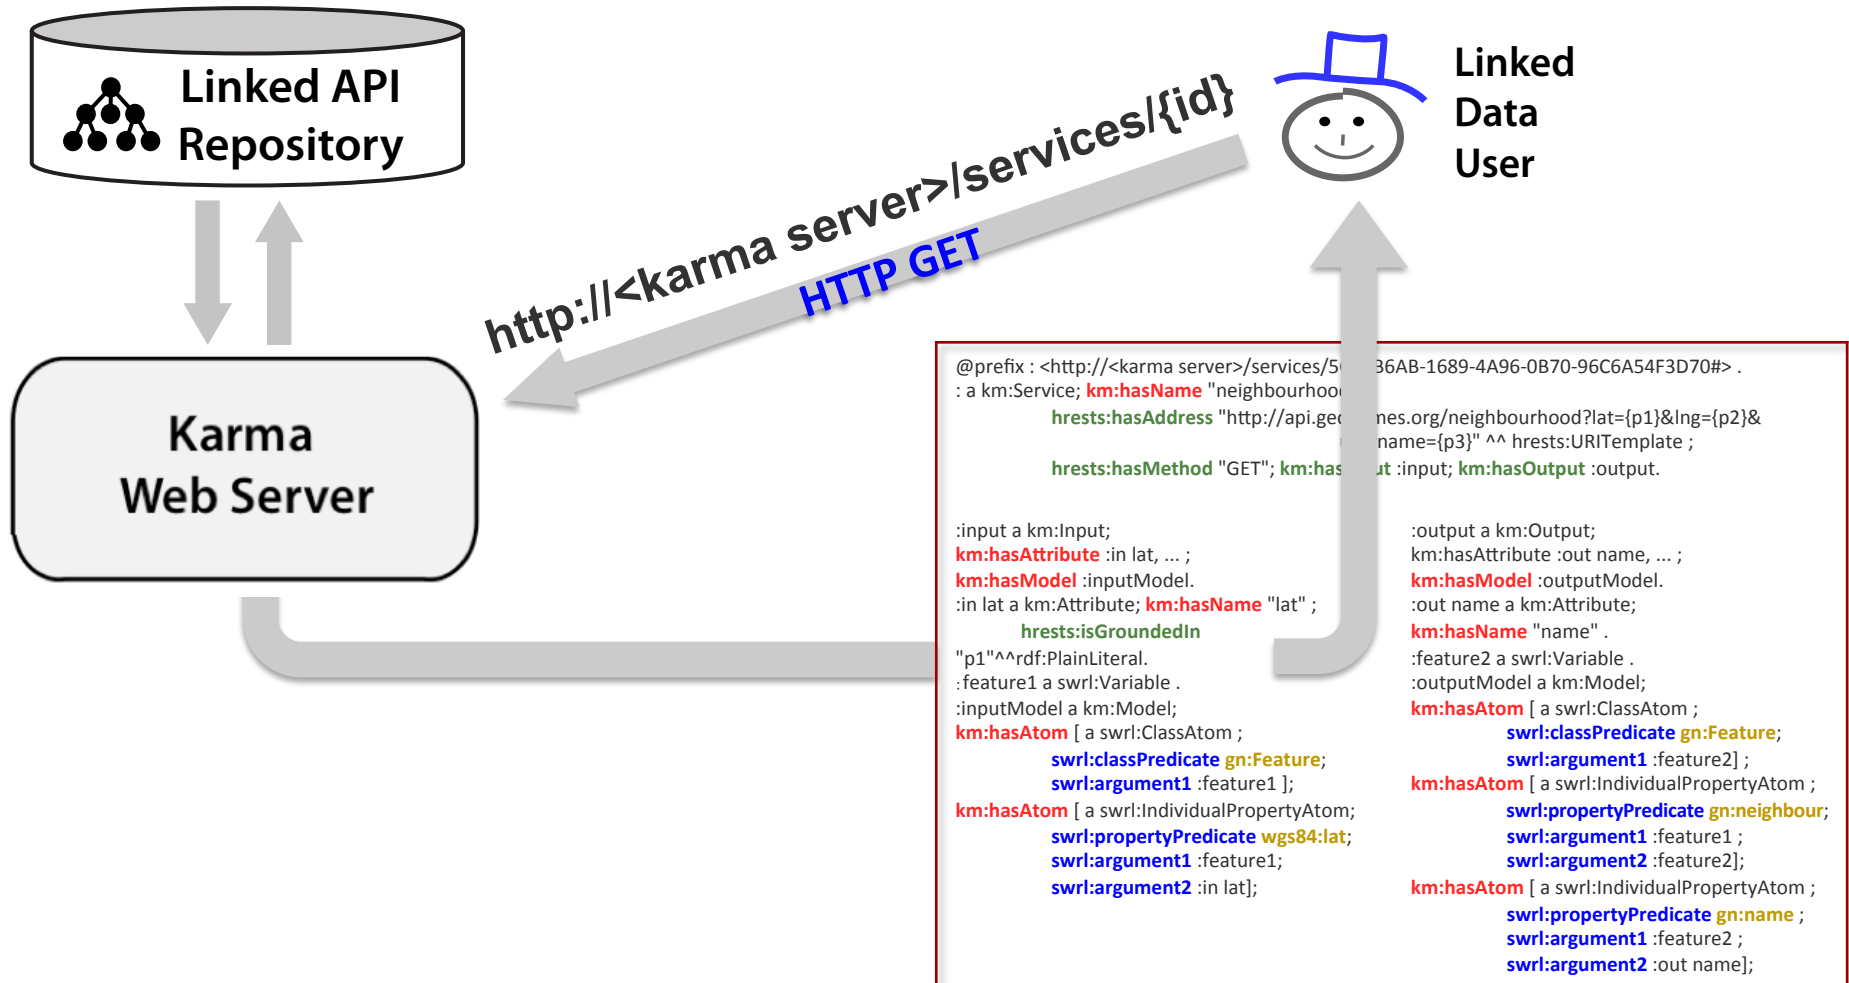

```
SELECT ?service WHERE {  
  ?service km:hasInput [km:hasAttribute ?i1, ?i2].  
  ?service km:hasInput [km:hasModel [km:hasAtom  
    [swrl:propertyPredicate wgs84:lat; swrl:argument2 ?i1],  
    [swrl:propertyPredicate wgs84:long; swrl:argument2 ?i2]]]  
}
```

- Find services that return the neighbor feature given the latitude and longitude
-

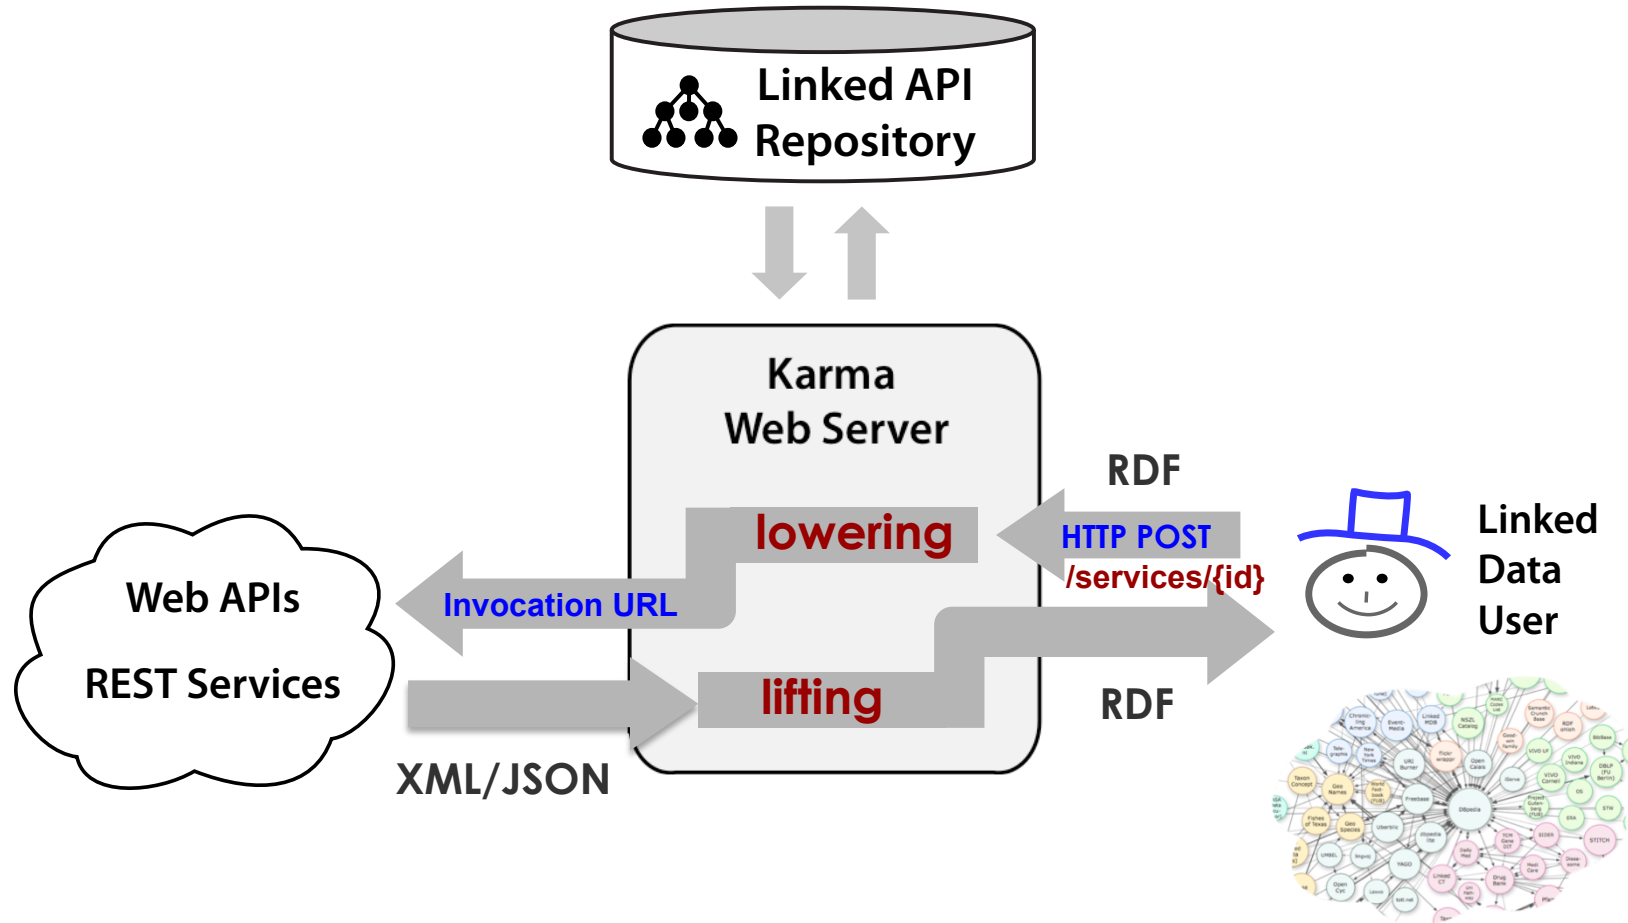

```
SELECT ?s WHERE {  
  ?s km:hasInput [km:hasAttribute ?i1, ?i2].  
  ?s km:hasOutput [km:hasAttribute ?o1].  
  ?s km:hasInput [km:hasModel [km:hasAtom  
    [swrl:classPredicate gn:Feature; swrl:arg1 ?f1],  
    [swrl:propertyPredicate wgs84:lat; swrl:arg1 ?f1; swrl:arg2 ?i1],  
    [swrl:propertyPredicate wgs84:long; swrl:arg1 ?f1; swrl:arg2 ?i2]]].  
  ?s km:hasOutput [km:hasModel [km:hasAtom  
    [swrl:classPredicate gn:Feature; swrl:arg1 ?f2],  
    [swrl:propertyPredicate gn:neighbour; swrl:arg1 ?f1; swrl:arg2 ?f2]]]}
```

Average 4 minutes to build a linked API

- Linked Services [Pedrinaci & Domingue, 2010]
 - Annotates inputs and outputs by concepts from ontologies
 - Publishes service descriptions into the LOD cloud using Minimal Service Model (MSM)
 - Cannot represent relationships between service attributes
- Linked Open Services (LOS) [Krummenacher & Norton & Marte, 2010] , Linked Data Services (LIDS) [Speiser & Harth, 2010]
 - SPARQL graph patterns to describe inputs and outputs
 - Service discovery is not straightforward
- RESTdesc [Verborgh et al, 2012]
 - N3 logical rules to capture API functionality

- Linked Services [Pedrinaci & Domingue, 2010]
 - Annotates inputs and outputs by concepts from ontologies
 - Publishes service descriptions into the LOD cloud using Minimalist Ontology Modeling (MOM)

Karma semi-automatically builds service descriptions and the modeling process does not require expertise in SW technologies

- SPARQL graph patterns to describe inputs and outputs
 - Service discovery is not straightforward
- RESTdesc [Verborgh et al, 2012]
 - N3 logical rules to capture API functionality

- Rapidly build rich semantic models of services
- Publish service descriptions into the LD cloud
- Provide strong support for service discovery and composition
- Build linked APIs that consume and produce linked data

Future Work

- Apply our approach on REST-like URLs
 - <http://www.ex.com/weather/CA/Los Angeles>
- Compose data and services in Karma

S1(address → street, city, state, zipcode,)

S2(city, state → temperature, windspeed, ...)

S3(zipcode, distance → hotel, ranking)

Composition

| events | |
|--------------|---|
| name | address |
| ACM GIS 2012 | 300 N. Harbor Drive Redondo Beach, CA 90277 |
| ISWC 2012 | 50 Park Plaza at Arlington Street, Boston, MA 02116 |

Steiner Tree Algorithm

Steiner nodes: {V1, V2, V3, V4}

1. construct the complete graph (Nodes: Steiner Nodes, Links Weights: shortest path from each pair in original G)

2. Compute MST

3. replace each link with the corresponding shortest path in original G

4. Compute MST

5. remove extra links until all leaves are Steiner nodes
